

To Whom It May Concern:

Allergy Partners is the largest allergy practice in the United States. We are based in Asheville, North Carolina, and currently have approximately 70 allergists and 12 mid-level providers and a total of over 500 employees. We see patients in approximately 55 locations in 14 states, and are actively growing. We will see approximately 45,000 new patients this year and have a total of over 150,000 patient visits. Our mission is to be the leader in the development and delivery of high-quality care for asthma and allergic disease. Part of our strategy is to modify our patients' immune response to tolerate our environment; another part is to create as healthy an environment as possible for our patients.

The data regarding the importance of clean air in human health is increasing every day. We have long recognized temporary irritant effects from smoke, fumes, etc., but are now finding more and more evidence of permanent adverse effects being triggered by temporary exposures. This evidence creates a compelling case for creating a clean home environment.

Additionally, our allergic patients are very sensitive to odors, which we are not able to treat effectively with immunotherapy. Patients exposed to these stimuli will often have an exacerbation of their underlying allergic condition.

Allergy Partners chose to endorse sgbblue and the Otwo unit as this represents a true advance in the world of home air purification. Airflow-based filters do an excellent job capturing airborne particulates, but often create so much suction that they actually draw particles into the air, which were otherwise lying dormant and not causing any adverse health effect. Additionally, many of the particles they remove are those treated very effectively with allergen immunotherapy. The Otwo unit, because of its charge-based attraction of particulates, represents a better real-world solution for particulates. It has the huge advantage of capturing volatile organic compounds (VOCs), which are responsible for many of the unpleasant odors we detect. This advantage makes the unit the first choice of many patients and providers, for both the benefits inherent in VOC removal as well as the easy identification of efficacy through odor removal.

Allergy Partners is excited about endorsing this groundbreaking approach to improving our environment and our patients' quality of life.

We anticipate a significant interest in and uptake of the product by our patients, and think this will spread across the entire allergy community once the word is out.

In short, sgblue has developed an elegant solution for a problem that has gone unanswered thus far. There is a need for a product that simply, safely, and efficiently removes not only particulates, but also the VOCs that are responsible for many adverse health effects and the bothersome, sometimes disabling odors they produce. I predict that sgblue's Otwo will be very successful.
